

Alien invasion lands in west London

A vision of what life on other planets might be like comes to earth at the Science Museum where experts in evolutionary biology, astronomy and biomechanics have created models of how life might have developed elsewhere in the universe. They created a colourful array of plants and animals that could exist on a different planet, under different conditions but based on their knowledge of how life developed on earth. The museum, in South Kensington, London, worked with a team of scientists led by the evolutionary biologist Simon Conway **11»** Morris who said the models were a good guess about what aliens would look like.
